

Our Experience at Brighter Future

*Patient: Breanna, Age 7
Written By Father*

Pre-Vision Therapy Experience:

Bree had trouble with focusing, staying on task, math seemed to be troublesome. Even though she could readily answer questions verbally, doing math problems on paper seemed extremely difficult for her. She had trouble with tracking moving objects without moving her head.

Computerized Vision Therapy Experience:

The home therapy seemed like games, Bree would often protest doing home therapy but once she started she often would not want to stop.

Post Therapy Experience:

Yes, we would recommend vision therapy to others! We already have. Bree's symptoms have diminished completely or are hardly noticeable. There has been a remarkable improvement in vision/motor skills. We think the program at BFVC is remarkable in the fact that so much is accomplished in what really is a short time; we felt that we were completely informed and received adequate information throughout the entire process.
